

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

A Letter from Lewis Weston Dillwyn, Esq., addressed to Sir Humphry Davy, Bart. P.R.S. Read March 25, 1824. [Phil. Trans. 1824, p. 413.]

This letter is supplementary to the former one, and contains further observations on the relative periods at which the different families of testaceous animals appear to have been created, and on the gradual approximation, which may be observed in British strata, from the fossil remains of the oldest formations to the living inhabitants of our present land and waters.

The author observes, that the dimyairia of the strata between the transition lime and lias have the ligament external, and that internal ligaments were therefore confined to the monomyairia till after the deposition of the lias. In the beds above the lias all the shells are referrible to existing orders of animals, and it is only in the tertiary beds that any of the cirrhipeda or families of naked mollusca have been found.

What is generally considered as the beak of a sepia, Mr. Dillwyn refers to the cephalopode animal of an ammonite. Every shell of the tertiary strata, the author observes, may be referred to some existing genus; but though this approximation has thus far proceeded in the London clay, yet its numerous species are now extinct, and it is only in the upper beds of crag that any fossil can be completely identified with a living species.

An Account of the Organs of Generation of the Mexican Proteus, called by the Natives Axolotl. By Sir Everard Home, Bart. V.P.R.S. Read June 17, 1824. [Phil. Trans. 1824, p. 419.]

The specimens described in this paper were taken in the month of June, in a lake three miles from Mexico, at an elevation of 8000 feet above the level of the sea. The usual temperature of the lake is 60°, and they are in such abundance as to form a principal article of food of the peasantry. By the assistance of annexed drawings by Mr. Bauer, Sir Everard fully describes the male and female organs of these animals, and is enabled to decide that they are a full grown and perfect tribe. "The attack therefore," says the author, "made upon Mr. John Hunter's sagacity by Mr. Rusconi, in his work *sur les Amours des Salamandres Aquatiques*, retorts upon himself."

An Account of Experiments on the Velocity of Sound, made in Holland. By Dr. G. Moll, Professor of Natural Philosophy in the University of Utrecht, and Dr. A. Van Beek. Read March 18, 1824. [Phil. Trans. 1824, p. 424.]

After adverting to the difference between the celerity of sound, as deduced by theory and found by experiment; and to Laplace's explanation of the cause of that difference, and his corrections of the Newtonian formula,—the authors proceed to consider the influence of
